Solutions & Systems Engineer

Solutions-focused technical professional with experience designing and building software that solves real-world operational problems across healthcare, government, and independently developed products. Strongest at translating stakeholder workflows into system designs, data models, integrations, automation, and working software across modern web and enterprise platforms.

TECHNICAL SKILLS

Languages: JavaScript, SQL, C#, HTML, CSS, VBA

Frameworks & Libraries: React, React Router, Node, Express, Blazor, Socket.IO

Databases: PostgreSQL, SQL Server (SSMS), Oracle

Cloud & APIs: Azure, Twilio, REST APIs, Cloudinary

Developer Tools: Beekeeper Studio, Git, GitHub, Render, Vercel, Visual Studio, VS Code

Enterprise Systems: Microsoft Access, Oracle WebCenter Content (WCC), ODBC, Workflow Design

TECHNICAL PROJECTS

Recovery Community | Solution Designer & Full-Stack Developer | 2026-Present

Working directly with the owner of an established Facebook-based recovery community to design and build a substantially complete owned community platform, now being prepared for private beta and migration from Facebook.

- Translated community and operational requirements into an application architecture covering membership admissions, role-based access, discussion, moderation, private messaging, notifications, protected media, analytics, and owner administration.
- Designed and built the React/Vite client, Node/Express REST API, Socket.IO real-time services, and PostgreSQL data model supporting identity, admissions, forum content, messaging, media, analytics, and editable public content.
- Implemented membership application, email verification, personal invitation and shared access-code workflows, with server-side authorization enforcing account status, role hierarchy, ownership, and conversation participation.
- Built privacy and security controls including protected image delivery, upload validation, image resizing and EXIF stripping, session invalidation, parameterized SQL, database constraints, and transactional email flows.
- Preparing the platform for private beta through technical documentation, security hardening, testing, real-user validation, and a coordinated migration strategy designed to avoid splitting the existing community between Facebook and the new platform.

Technologies: React • Vite • Node • Express • PostgreSQL • Socket.IO • JWT • Cloudinary • REST APIs • Vercel • Git • GitHub

Horizon | Founder & Full-Stack Developer | 2026-Present

Founded and built Horizon, a web platform that consolidates Raid-Helper events from multiple Discord communities into a single scheduling experience.

- Identified a fragmented workflow affecting players across multiple Discord communities and designed a software solution that eliminates manual event tracking.
- Managed the product lifecycle from concept and architecture through development, deployment, Chrome Web Store publication, analytics, and ongoing feature development.
- Designed and built the React frontend, Express API, PostgreSQL database, external API integrations, and deployment architecture.
- Published a companion Chrome Extension that streamlines importing Raid-Helper events; Horizon has tracked 50+ communities representing 1,500+ scheduled raids.

Technologies: React • Node • Express • PostgreSQL • REST APIs • Chrome Extension APIs • Render • Vercel • Neon • Git • GitHub

ADDITIONAL PROJECTS

LootLink | Full-Stack Developer | Fullstack Academy Capstone | 2026

Collaborated with a four-person development team to build a social platform that helps gamers discover, organize, and communicate with teammates across multiple gaming platforms.

- Developed features across the frontend, backend, and database using React, Express, and PostgreSQL.
- Implemented authentication, notifications, reviews, session management, messaging, and third-party gaming platform integrations.
- Worked within a team environment using Git, feature branches, pull requests, and code reviews.

Technologies: React • Node • Express • PostgreSQL • JWT • REST APIs • Git • GitHub

Volume by Site | Founder & Developer | 2026

Designed and published a focused Chrome Extension that remembers and restores preferred volume levels on a per-website basis, eliminating repeated audio adjustment across streaming and communication platforms.

- Developed persistent, site-specific audio preferences that automatically restore user-defined volume levels when supported websites are revisited.
- Published and maintained the extension through the Chrome Web Store.

Technologies: JavaScript • Chrome Extension APIs • Local Storage • Git • Chrome Web Store

EXPERIENCE

Developer / Analyst | Tejas HMA | Austin, TX | 2023-2025

Inherited a partially developed healthcare communication platform built with Blazor, Azure, SQL Server, and Twilio, and became the sole developer responsible for its continued development, production readiness, and ongoing maintenance.

- Learned an unfamiliar application architecture and delivered production-ready features across the UI, backend services, SQL Server database, stored procedures, and Twilio integrations.
- Redesigned campaign architecture from a flat structure into a parent/child model supporting configurable voice, SMS, and email workflows while improving flexibility and future scalability.
- Redesigned patient response tracking to preserve complete communication history, capturing multiple interactions, free-form responses, and invalid keypresses through coordinated database, stored procedure, Twilio, and UI enhancements.
- Partnered with stakeholders over several months to translate healthcare reporting requirements into a complex SQL reporting solution and validate the resulting database logic.
- Collaborated on feature design and technical solutions, independently implementing enhancements from concept through deployment while maintaining application stability in production.

Technical Analyst | PACO Technologies / Texas Commission on Environmental Quality (TCEQ) | Austin, TX | 2013-2023

Progressed from Imaging Clerk through team leadership and Records Analyst roles to Technical Analyst. Served as PacoTech's sole technical staff member on these projects, collaborating with TCEQ IT, implementation vendors, and operational staff.

- Developed the primary data map, staging tables, and transformation queries for the InSight-to-Oracle WebCenter Content migration involving 3.1 million inventory items; prepared data for the vendor's final transfer.
- Translated operational needs into system requirements, designed test plans, coordinated staff testing, and verified migration results through database queries.
- Designed and maintained a centralized Access/VBA application connected to Oracle through ODBC, integrating departmental workflows into one shared operational system used daily by 30-50 staff.
- Replaced purchased vendor scanning software with an automated import workflow that validated uploads and prevented incomplete processing from advancing.
- Built a separate application for a later Document Review and Redaction (DRR) contract, adapting and improving two departments' workflows from the original platform to track reviews, findings, errors, and staff productivity alongside WCC.
- Built work queues, dashboards, and reporting tools that gave staff and supervisors visibility into workload, processing status, and production.

Employer case studies: Data Migration Document Review & Redaction

EDUCATION

Fullstack Academy | Software Engineering Certificate | 2026

University of San Francisco | Bachelor of Science, Mathematics | 2012
