Software Developer

Software developer with experience designing and building software that solves real-world operational problems across healthcare, government, and independently developed software products using modern web technologies and enterprise application platforms.

TECHNICAL SKILLS

Languages: JavaScript, SQL, C#, HTML, CSS, VBA

Frameworks & Libraries: React, React Router, Node, Express, Blazor

Databases: PostgreSQL, SQL Server (SSMS), Oracle

Cloud & APIs: Azure, Twilio, REST APIs

Developer Tools: Beekeeper Studio, Git, GitHub, Render, Vercel, Visual Studio, VS Code

Enterprise Systems: Microsoft Access, Oracle WebCenter Content (WCC), ODBC, Workflow Design

TECHNICAL PROJECTS

Horizon | Independent Full-Stack Developer | 2026–Present

Developed **Horizon**, a SaaS platform that helps gaming communities organize and manage raid schedules by consolidating Raid-Helper events from multiple Discord servers into a single application.

- Identified a workflow problem experienced by players participating in multiple Discord communities and designed a software solution to eliminate manual event tracking.
- Managed the complete product lifecycle from concept and architecture through development, deployment, Chrome Web Store publication, and ongoing feature development.
- Designed and developed the complete application architecture, including the React frontend, Express API, PostgreSQL database, authentication, deployment infrastructure, and external API integrations.
- Published a companion Chrome Extension that streamlines importing Raid-Helper events directly into Horizon, creating an integrated browser-to-web application workflow.
- Continue to ship production updates, add new features, and improve the platform based on user feedback.

Technologies: React • Node • Express • PostgreSQL • Discord API • REST APIs • Chrome Extension APIs • Render • Vercel • Neon • Git • [Horizon](#) • [Chrome Web Store](#) • [GitHub](#)

LootLink | Full-Stack Developer | Fullstack Academy Capstone | 2026

Collaborated with a four-person development team to build Fullstack Academy's capstone project, a social platform that helps gamers discover, organize, and communicate with teammates across multiple gaming platforms.

- Developed features across the frontend, backend, and database using React, Express, and PostgreSQL.
- Implemented authentication, notifications, reviews, session management, messaging, and third-party gaming platform integrations.
- Worked within a team environment using Git, feature branches, pull requests, and code reviews.

Technologies: React • Node • Express • PostgreSQL • JWT • REST APIs • Git • [GitHub](#)

Volume by Site | Founder & Developer | 2026

Designed and published a Chrome Extension that automatically remembers and restores preferred volume levels on a per-website basis, eliminating the need for users to continually adjust audio across streaming and communication platforms.

- Developed persistent, site-specific audio preferences that automatically restore user-defined volume levels whenever supported websites are revisited.
- Delivers a lightweight user experience supporting configurable volume levels across websites such as YouTube, Discord, Twitch, Amazon Prime Video, and HBO Max.
- Published and maintained the extension through the Chrome Web Store.

Technologies: JavaScript • Chrome Extension APIs • Local Storage • Git • [Chrome Web Store](#)

CURRENT PROJECTS

Wellness Recovery Community | Full-Stack Developer | 2026–Present

Developing a full-stack online recovery platform for a nonprofit organization focused on connecting individuals through educational resources, peer support, and community engagement.

- Designing a responsive marketing website and authenticated community experience.
- Working directly with the organization owner to turn product requirements into implemented features.
- Building the application iteratively while preparing for forums, messaging, user accounts, and additional community functionality.

Technologies: React • Vite • CSS • Node (planned) • Express (planned) • PostgreSQL (planned)

EXPERIENCE

Developer / Analyst | Tejas HMA | Austin, TX | 2023–2025

Contributed to AppointmentWave, a production healthcare communication platform built with Blazor, Azure, SQL Server, and Twilio that automates patient outreach, appointment reminders, and communication workflows.

- Took ownership of a production healthcare application by learning an unfamiliar web architecture and delivering production-ready features across the UI, backend services, SQL Server, and Twilio integrations.
- Redesigned the campaign architecture from a flat structure into a parent/child model supporting configurable voice, SMS, and email workflows while improving flexibility and future scalability.
- Redesigned patient response tracking to preserve complete communication history, capturing multiple interactions, free-form responses, and invalid keypresses through coordinated database, stored procedure, Twilio, and UI enhancements.
- Partnered with stakeholders over several months to design and deliver a complex SQL reporting solution by translating healthcare reporting requirements into accurate database logic.
- Collaborated on feature design and technical solutions, independently implementing enhancements from concept through deployment while maintaining application stability in production.

Technical Analyst | PACO Technologies / Texas Commission on Environmental Quality (TCEQ) | Austin, TX | 2013–2023

Promoted from Imaging Clerk to Team Lead, Assistant Supervisor, Records Analyst, and ultimately Technical Analyst over a decade supporting TCEQ operations.

- Developed internal enterprise software supporting document imaging, public records, and records management operations for the Texas Commission on Environmental Quality.
- Designed and developed an enterprise workflow application used daily by **30–50 staff members** across multiple departments to manage document imaging, public information requests, quality control, redaction workflows, and records management.
- Replaced purchased vendor scanning software by developing a faster automated import system integrated with Oracle WebCenter Content through ODBC, improving reliability while reducing manual intervention.
- Designed end-to-end workflows supporting document intake, batching, scanning, quality assurance, cloud upload, redaction, destruction, and productivity tracking through custom Microsoft Access and VBA applications.
- Developed automated validation routines that verified file imports, enforced data integrity, and prevented incomplete processing from advancing through the workflow.
- Built dashboards, work queues, productivity metrics, reporting tools, and management interfaces that became the primary operational software used by staff and supervisors.

EDUCATION

Fullstack Academy | Software Engineering Certificate | 2026

University of San Francisco | Bachelor of Arts, Mathematics | 2012
